Environmental Protection Preservation Restoration Solutions

**Mammoth Block**  
Waste to Product Innovation  
2.4m x 1.2m x 1.2m

The Mammoth Block Innovation will have far reaching benefits not only in the waste management industry. The Mammoth Block will hold two massive compressed bales of non recyclable waste plastic, giving the product great insulation properties .The benefits are enormous for the waste and construction industries.

The blocks have great insulation properties against extreme weather conditions. This product would suit areas affected by cyclones, tornadoes, landslides, tailing dam failures, and **coastal and soil erosion problems**. Ideal for coastal erosion barriers. The blocks have a pleasing look about them and will blend well into the environment. Mammoth blocks are a great product for projects such as the Snowy Hydro Scheme, rail, mining and civil engineering projects

The Mammoth System can be set up in any landfill or waste facility anywhere in the world. This will have a massive impact in the reduction of the non recyclable plastic waste on our planet.

The blocks are made from galvanised, reinforced precast concrete. The blocks are very cost effective to transport due to the reduction in concrete to make the block, this is waste to product innovation at it's very best.

Environmentally friendly living, less emissions and with a very low carbon footprint.

The Mammoth Block is 2.4m x 1.2m x 1.2m with a 1.2m x 1.2m end cube.

Combat climate change and support our local councils in their efforts to reduce the massive problem they have with plastic waste and other problematic materials like tyres. Help them in the challenges they face with coastal erosion.

Helping to save our habitat for our future generations to come... till we find something better.
