

RESCUE DEFENDER SUIT

I think this kind of product when I see in Television news, a man was inside a cage of Lion in a Zoo attacked by the Lion, wounded and unconscious, some persons are trying to deter the Lion with a stick and others helplessly watching. Next day's newspaper show the news of death of that person. Mostly, the workers in the Zoos are the victims of this kind of tragic incident .If anybody can safely entered the cage in time, that man can be rescued, This incident think me about a product to use this kind of situation

A non metal made flexible suit (like riot control suit of police) consisting three part covering all part of the body, the first part covering head to neck with glass or other transparent material in front (like Bike Helmet) the second part covering neck to hip . Hand can rotate freely and outer surface of hand from elbow to wrist covered with any electrical conductor metal (Aluminium Copper etc.) with this metal covering hands prevent an attacking animal by giving electric shock, besides this, this strong metal hand can also prevent beats and bite of the animal. In the top of the head towards front a 50 cm long pipe fitted for flame throwing(All animal has fear of fire) with this flame can throw to 3 to 5 metre, the flame can deter the animal from victim and the rescuer carry the victim in hand and walk backward using flame to prevent animal coming towards him. The third part covering from hip to ankle. A removable cabin fitted back consist gas chamber for flame and battery for electricity(If need two separate cabin can fitted two side of backbone for gas and battery), another cabin in left or right side of stomach with sledging shutter consisting switches for operation of flame, and electricity. Regulator

switch control the power of electricity to various level for different kind of animal and also control the interval of flame throwing. This type of preventing method has less chance to hurt the animal. This suit is also use outside rescue operation , such as rescuing wasp attack honey bee attack birds attack python attack and any other reptile attack including crocodile

Another use of this suit is in safari parks .Now people go to safari park while using covered vehicle to watch lion and other wild animals, if a person use this suit he can go fearlessly near the animal for a close look as he desired. The authorities of the park can reduce the running expense while using this suit considerably compare with using vehicle (Big initial cost of the vehicle, drivers salary, petrol etc.)This suit can also use in forest for observing animal in short distance. A communication device may include in the suit in this purpose.

Another use of this suit is, it is a new method of control violent mob. Like animal people has also fear of fire. The police has now use riot control gear and electric baton or stun gun to prevent violence control, This is a combination of both of these and use effectively to control the violent mob using both hand simultaneously by giving electric shock and with fine defence with metal hand. (The stun gun may be captured by the mob and use reverse)Violence increasing all over the world that means this product may be use in large scale

A modified version of this suit can use for fire rescue operation. In this suit no metal arm and no power supply. From the head pipe a fire extinguish gas may be used to enter the fire with free hand(Pipe must rotating type and upward downward movement for covering all area to use gas and suit must made non melting , heat resisting substance A oxygen supply cylinder may also included in the chamber for sufficient supply of oxygen cable through inside the suit in to the helmet. A

remote control operation for extinguishing gas from outside is more helpful to rescuer in the operation more concentration his rescuing work without bother about controlling the gas operation

The most important is these suit fully covered it is made from non metal and light weight element and all part can be covered wear quickly and easily, even a single minute is precious and upper part and middle part can fitted tightly with flexible and detachable pipe from head to gas chamber fitted each other behind the neck quickly
